Automating Employee Data

Team Leader: Santhiya M

Team Member: Swetha S

Team Member: Grace Jenifer S

Team Member: Yuvasri S

PROBLEM STATEMENT

Organizations often manage employee data manually using spreadsheets or paper records, which leads to errors, data duplication, and difficulty in accessing and updating information. The problem is to develop an automated employee data management system that stores, updates, and retrieves employee information efficiently, reduces human error, and improves overall data accuracy and accessibility.

OBJECTIVE

To develop an automated employee data management system that efficiently stores, updates, and retrieves employee information,reduces manual errors, and improves data accuracy and accessibility.

SKILLS:

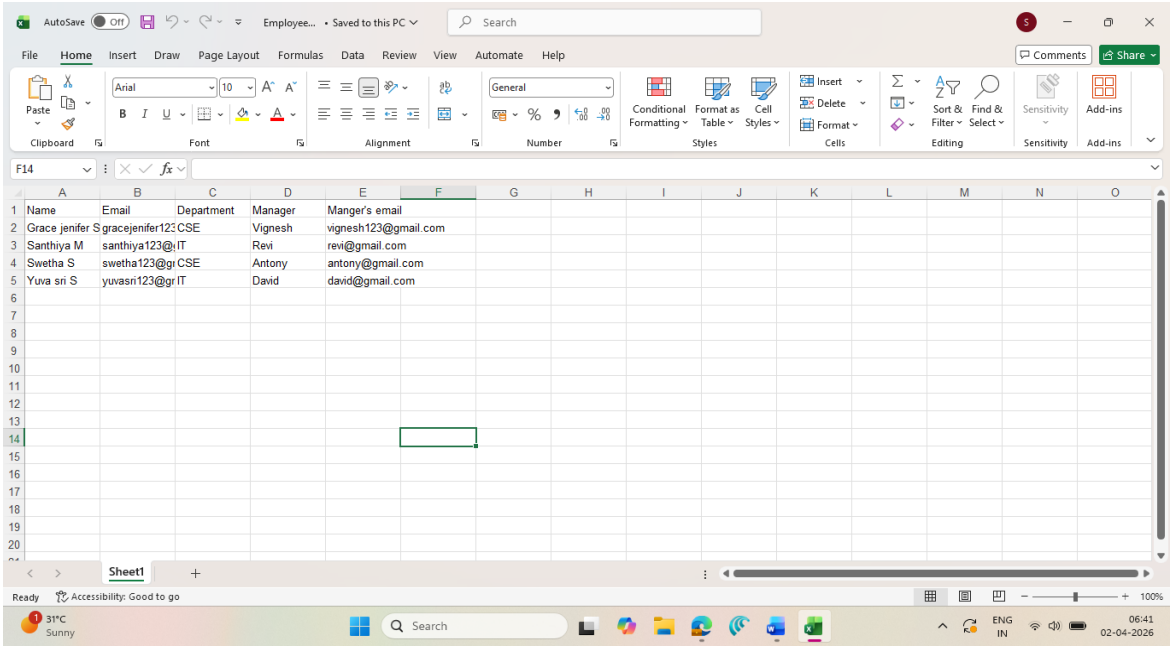
- Import data from data source
- Dot walking
- Dictionary override

TASK INITIATION:

Milestone 1: Import data from data source

Activity 1: Create records in the Sheet

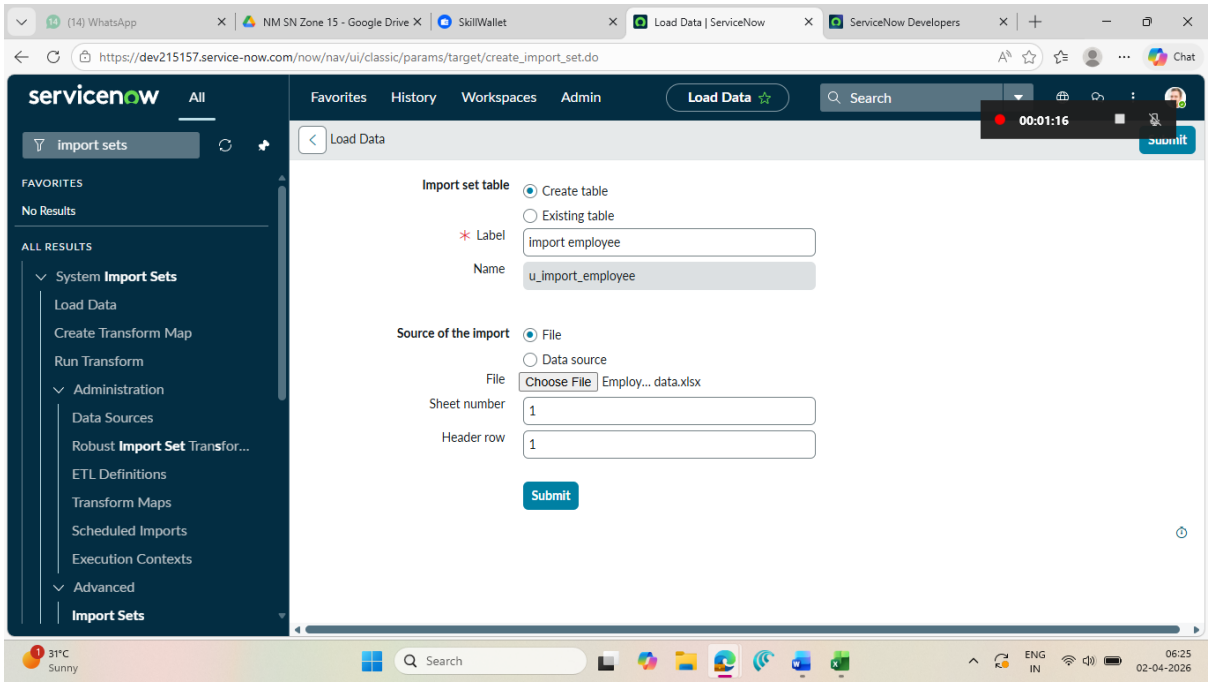
- Open google sheet
- Name the fields as name,email,department manager and manager's email
- Enter some records
- Save the sheet as: employee data
- Download the file as .xlsx , .csv (or) .xml file



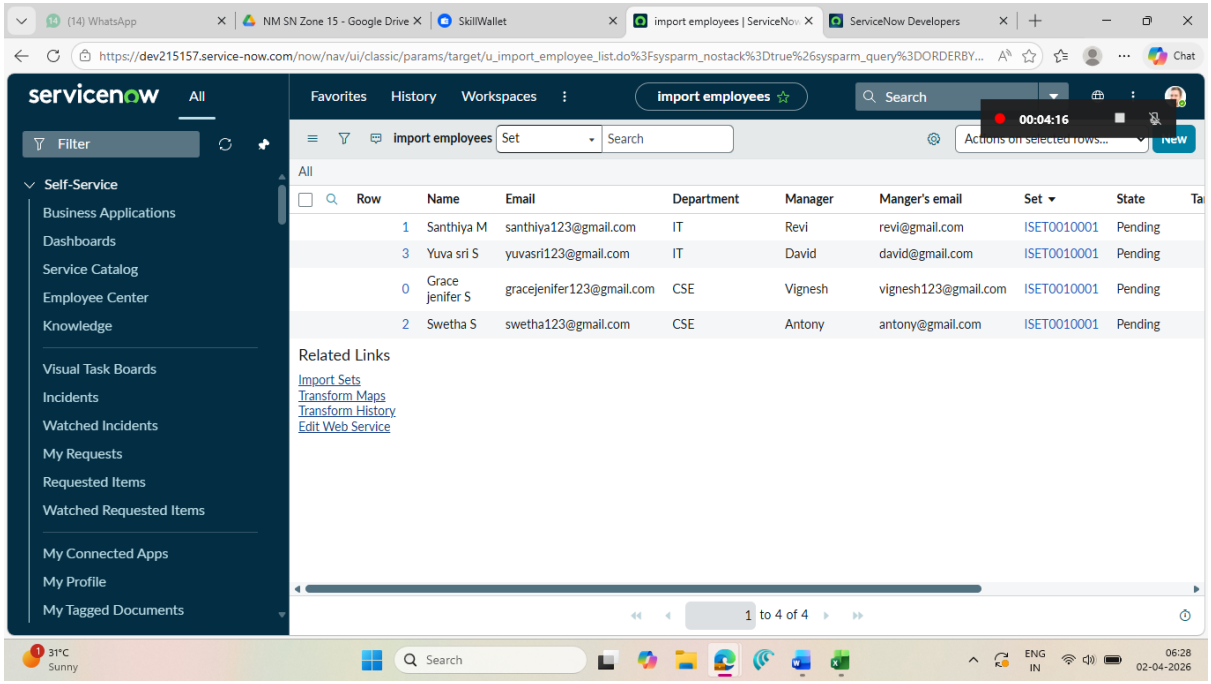
Name	Email	Department	Manager	Manger's email
Grace jenifer S	gracejenifer123	CSE	Vignesh	vignesh123@gmail.com
Santhiya M	santhiya123@	IT	Revi	revi@gmail.com
Swetha S	swetha123@gr	CSE	Antony	antony@gmail.com
Yuva sri S	yuvasri123@gr	IT	David	david@gmail.com

Activity 2: Import data

- Open service now.
- Click on All >> search for import sets
- Select load data under system import sets
- select create table
- Give the the import set table name as: import employee
- Choose the file which we created in the XL sheet.

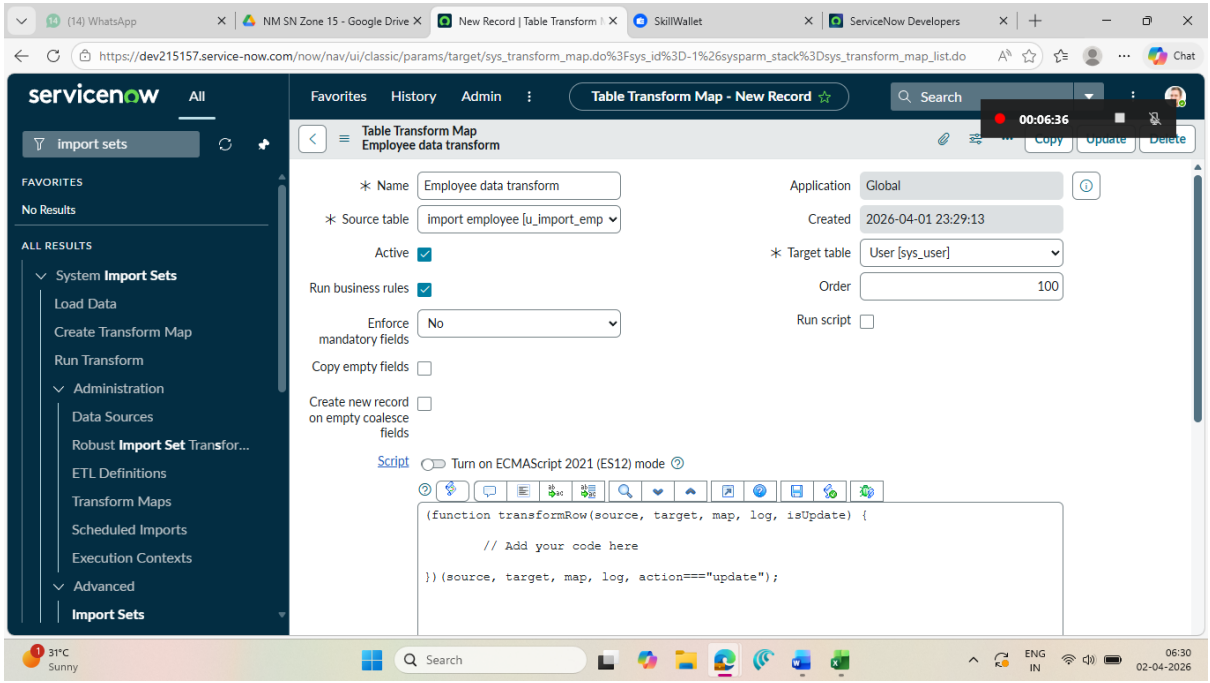


- The data is imported,click on personalized list
- Add fields to the form.



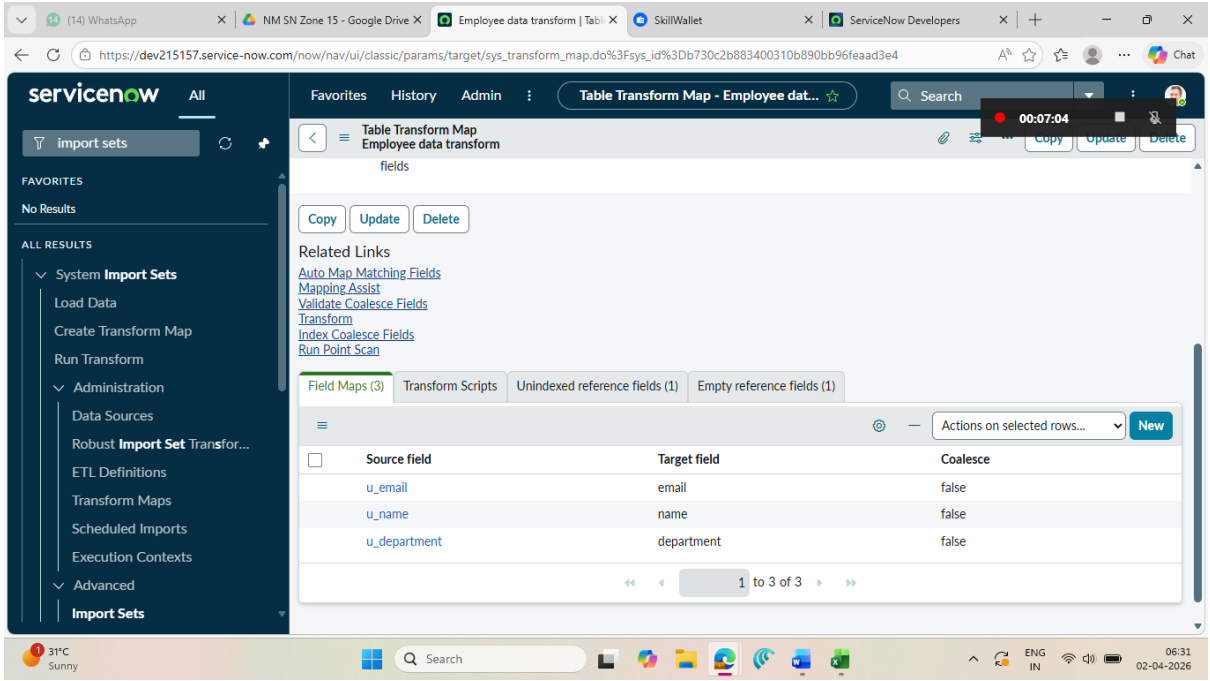
Activity 3: Create transform map

- Open service now.
- Click on All >> search for import set
- Select create transform map under import sets
- Click on new
- Fill the following details to create a new transform map
- Give name as: Employee data transform
- Select source table: import employee data
- Select target table: user[sys_user]
- Save the form.

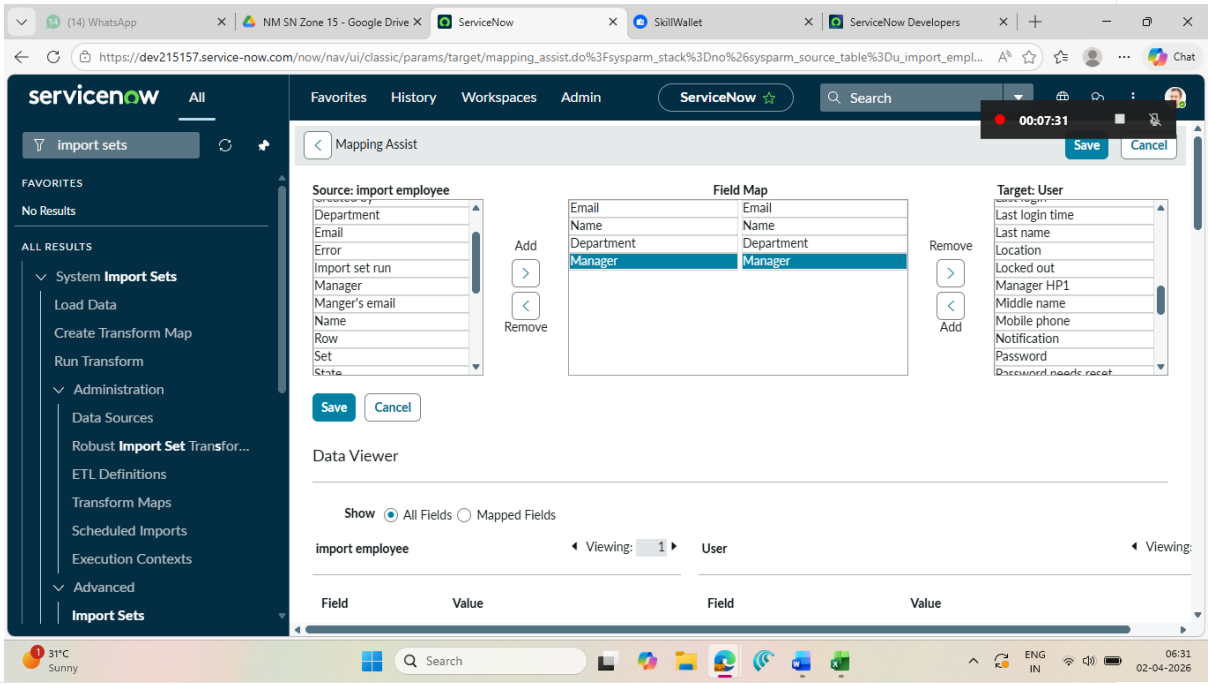


Activity 4: Match the fields using mapping assist

- Scrolled down the created transform map form
- Click on auto matching fields
- Then in the mapping fields some fields are matched

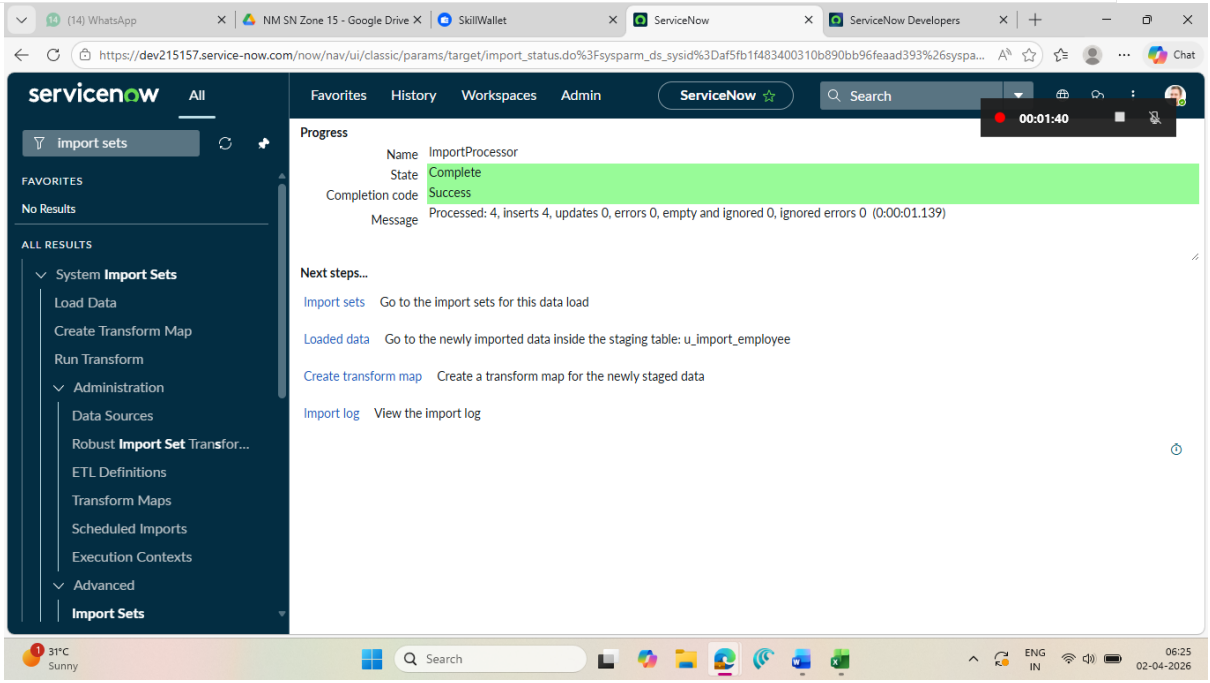


- Using mapping assist map the manager field.
- Select the fields which you are mapping in the staging table and target table
- Select manager in source table and add
- Select manager field in target table
- Click on the save button.

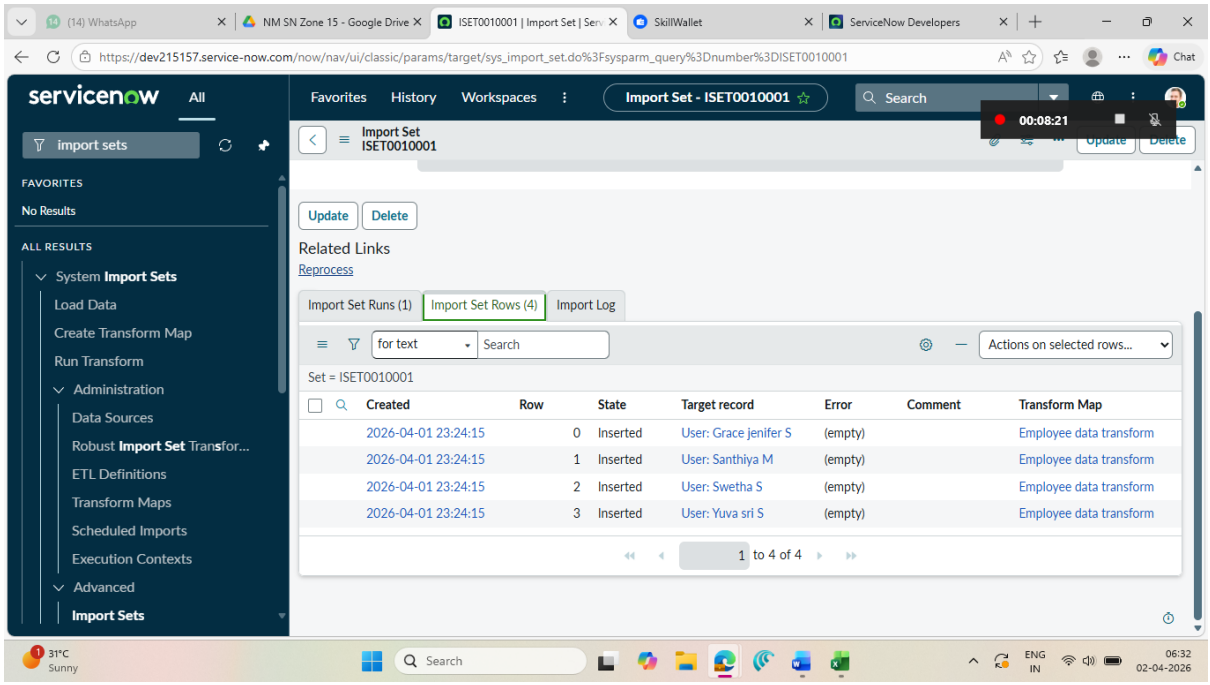


Activity 5: Transform the Data

- Click on transform in the related links.
- Click on transform.
- Data's transform state is completed.



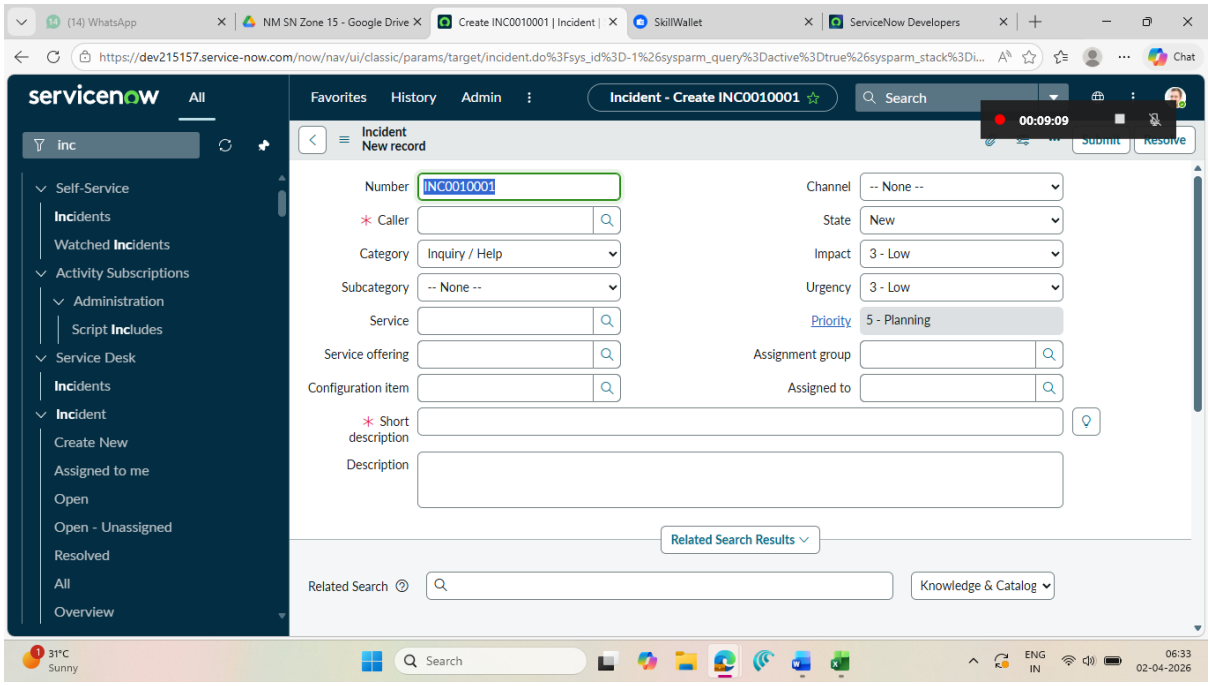
- Click on ISET0010003 under next steps
- Two rows are inserted.



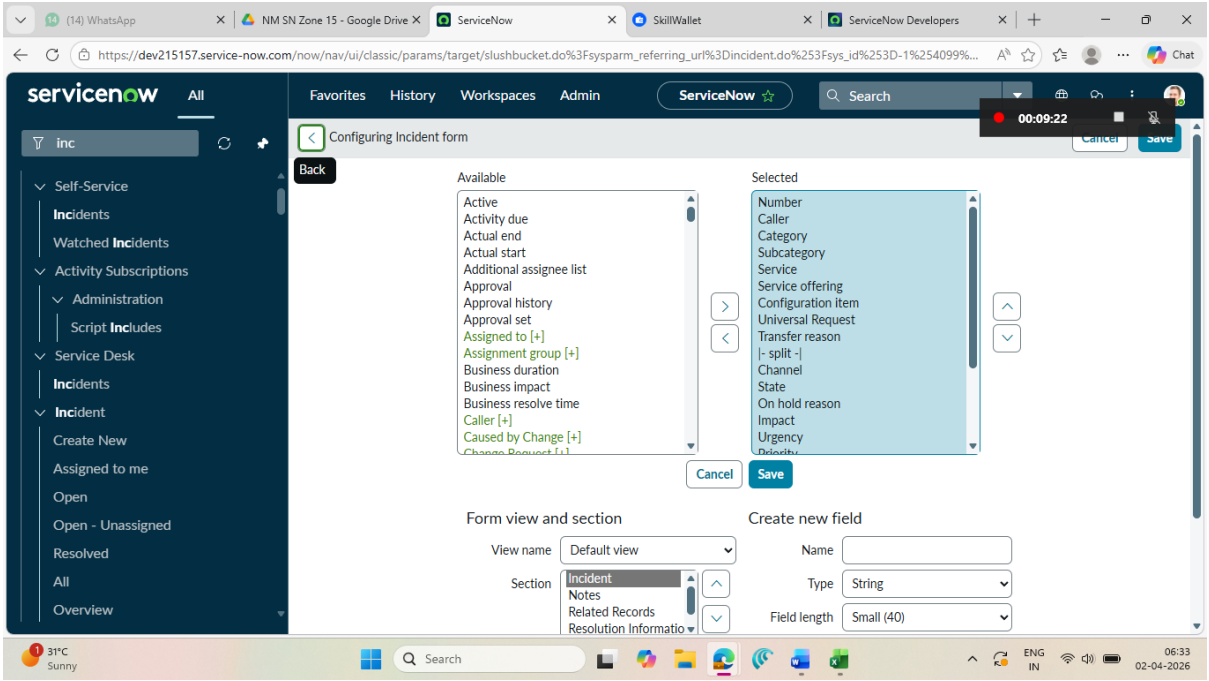
Milestone 2: Dot walking

Activity 1: Display department to the assigned to use

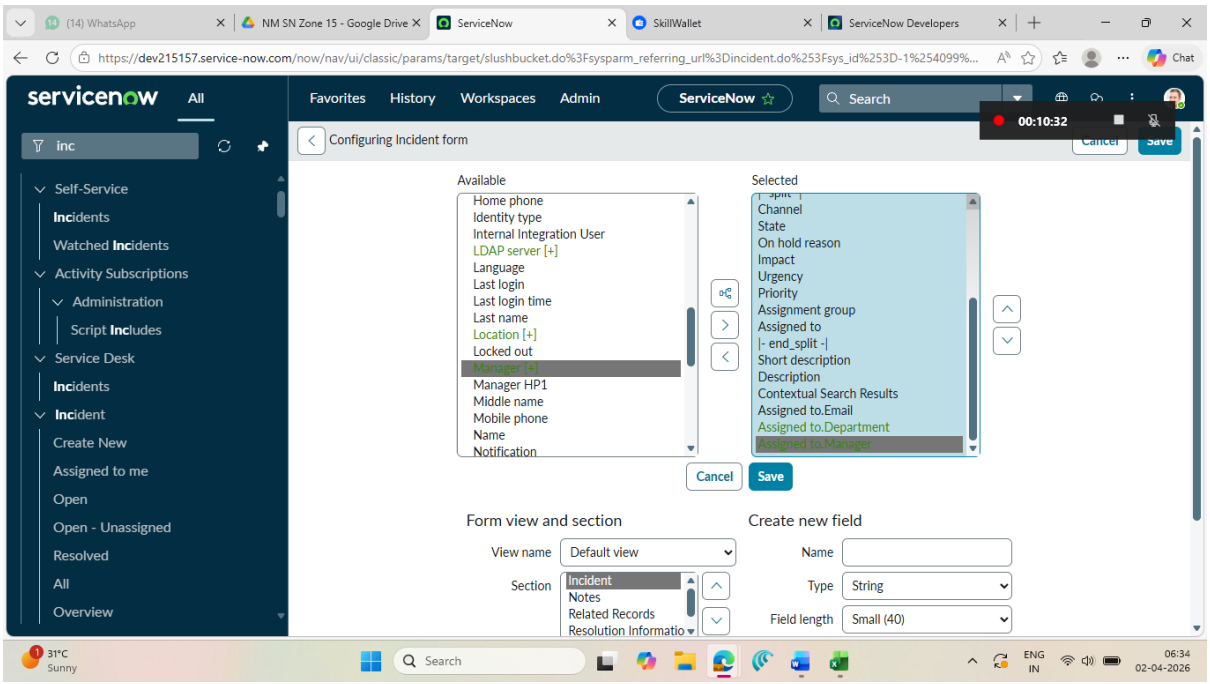
- Open service now.
- Click on All >> incident
- Select create new under incidents
- There is no field like department in the form
- Email and manager fields are not visible



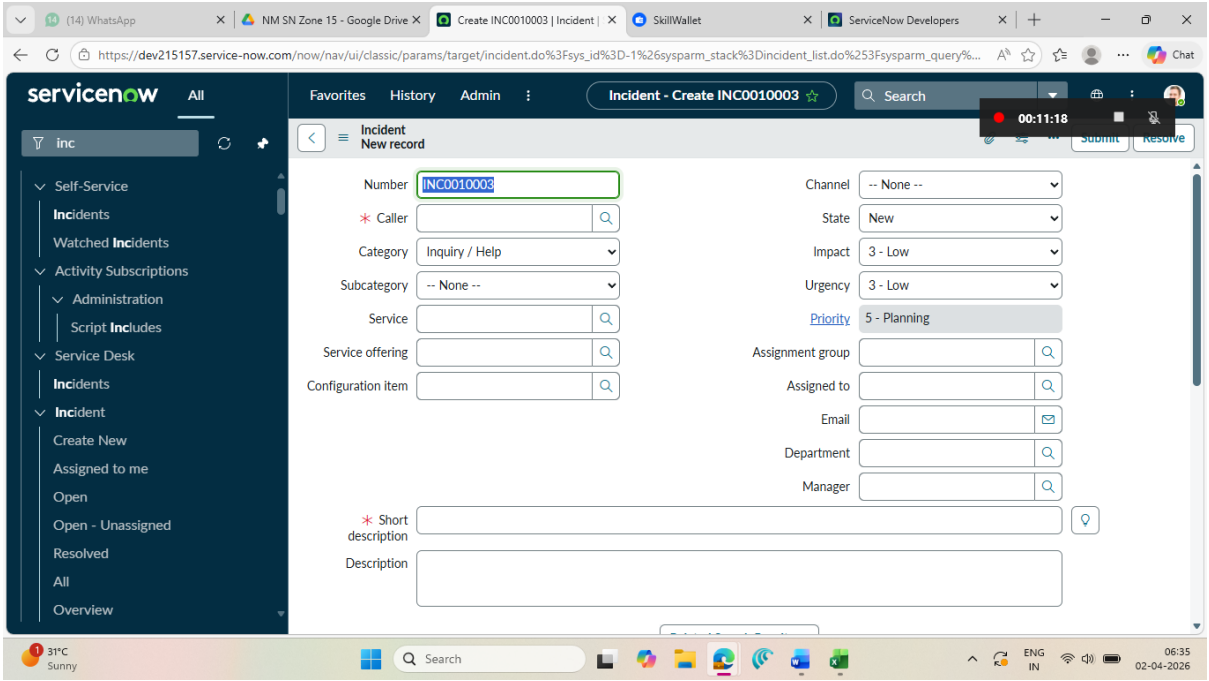
- By using dot walking retrieve the data without opening the record
- Click on context menu go to configure and select form layout
- Select assigned to.department as mentioned below
- Click on save.



- Add another field [assignment.email]().
- Also add assignment.manager field
- Click on save



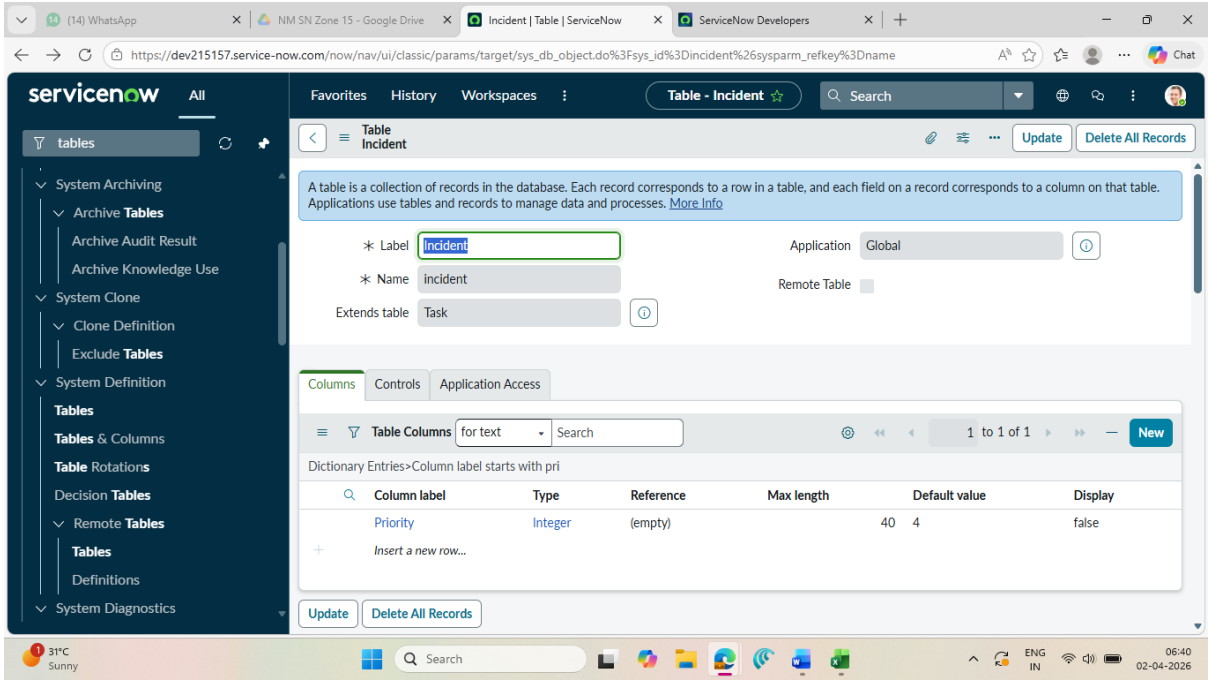
- Open an incident form
- Fill the mandatory fields and assigned to just imported user
- Then department and email field is automatically filled



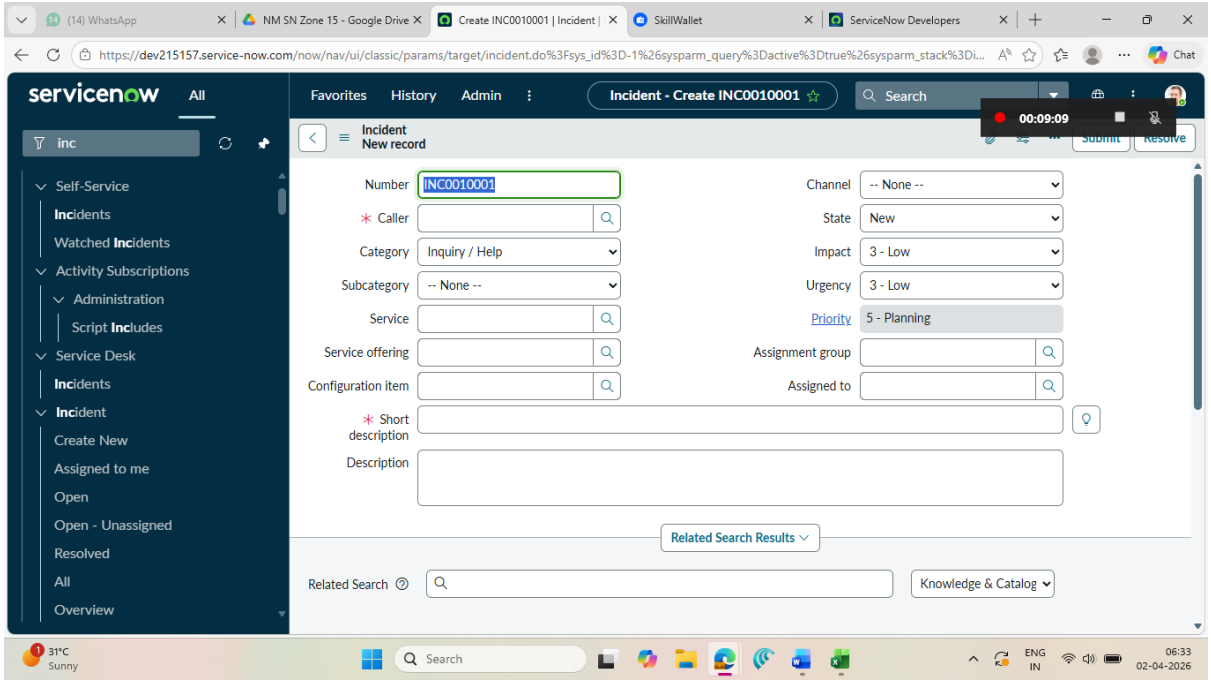
MILESTONE 3: Dictionary override

Activity 1: Make the state to 3-moderate in incident

- Navigate to All → System Definition → Tables.
- Either:
- Use the existing Incident table (which extends Task), OR
- Create a new table (e.g., u_incident_table) and set Extends Table = Task.
- Open the Incident (or extended) table record.
- Go to the Columns related list and open the Priority field. Notice the default value is inherited from the Task table (e.g., 4 – Low).
- Scroll down and locate the Dictionary Overrides related list.



- Click New under Dictionary Overrides.
- Fill the following details:
- Table: Incident (or your extended table)
- Column name: Priority
- Check Override default value
- Set Default value = 3
- Click Submit.
- Open a new Incident record and verify that the Priority now defaults to 3 – Moderate, while the Task table still retains its original default value.



CONCLUSION:

Automating employee data helps organizations work faster and more accurately. It reduces manual work, avoids errors, and makes it easy to access and manage information. This allows HR teams to save time and focus on important tasks. Overall, automation makes employee data management more efficient and reliable.
